

PRANA

ABSTRACT

After the pandemic, we can see that many people are suffering from many health issues where respiratory diseases like Asthma ,Bronchiolitis ,etc. are one of them. During the attack (for serious patients), they lose their consciousness and are unable to take breath. Hence at least one person should be there during this kind of attack to give a dosage by nebulizer to the patient's mouth. To avoid these situations, we have come up with an idea called THE AUTOMATIC NEBULIZER. It is a portable device which is designed on a cap. When the patient experiences an attack, the nebulizer is activated automatically and ensures that the medication is delivered directly to the mouth.The suitable vaccine can be inserted in the mist sprayer for different types of patients suffering respiratory diseases.
